Name: JOSHUA CONLEY
MRN #: 400340590
Phone: (401)207-4275
DOB: 30-Nov-1979 Age: 42

Gender: M
Exam Start: 15-Nov-2022 11:42 AM
Referring Phys.: Annie Genemian DC
Phone: (401)365-1212
Fax: (401)365-1214

Exam: MRI Lumbar Spine w/o contrast 72148
Reason: Acute low back pain with rad to bilat LE

MRI of the lumbar spine without contrast:

History: Acute low back pain radiating to the lower extremities bilaterally.

Technique: Multiplanar non contrast sequences were obtained of the lumbar spine.

Findings: There is no evidence of a mass lesion present about the conus. There is no evidence of lumbar vertebral body marrow replacement.

L1-2: The disc is normally hydrated. There is no disc herniation, central or foraminal stenosis.

L2-3: The disc is normally hydrated. There is no disc herniation, central or neural foraminal stenosis seen.

L3-4: The disc is normally hydrated. There is no disc herniation nor significant central stenosis. Foraminal narrowing is minimal.

L4-5: There is disc bulge with annular fissure. There is bilateral facet prominence. There is a mild degree of central stenosis. The foraminal narrowing is mild bilaterally.

L5-S1: There is Grade I spondylolisthesis of L5 on S1. There is disc bulge to the right with bilateral facet overgrowth. The spinal stenosis is mild. There is severe bilateral foraminal narrowing with disc uplifting the L5 nerve roots bilaterally. There is no clear spondylolysis. This could be verified with a higher degree of certainty with CT follow up. There is marrow edema about the pedicles of L5 and S1, which is subtle.

IMPRESSION:

1. Grade I spondylolisthesis of L5 on S1 without convincing spondylolysis with mild

central canal compromise and severe bilateral foraminal narrowing. Spondylolysis could be excluded with a higher degree of certainty with CT follow up.

2. Bulge at L4-5 with annular fissure and mild central stenosis.
